

Easy Look Architecture

- 1 The Agent set up a Secure WebSocket connection to the Web Server using a Custom-ID and Custom-password. This connection is permanent with auto-restart if broken for some reason.
- 2 The Mobile User set up a Secure WebSocket connection to the Web Server using the same Custom-ID and Custom-password. This connection has a 5 minutes inactivity timeout.
- 3 Using normal SNMPc credential (login account and password) the Mobile User send queries about Network Status etc. to the Agent, who is forwarded the tasks to the SNMPc system. Replies is sent back to the Mobile User.

* The WebSocket (RFC6455) connection is default set up with strong security (encrypted SSL protocol and certificate) over port 443.
